5.2.2	Using the ‘pencil’ module	7

1 Download the Pencil Code

The Pencil Code is an open source code written mainly in FORTRAN and available under GPL. General information can be found at our official homepage:

<http://pencil-code.nordita.org/>.

The latest version of the code can be downloaded with `svn`. In the directory where you want to put the code, type:

```
svn checkout http://pencil-code.googlecode.com/svn/trunk/ pencil-code
```

The downloaded ‘pencil-code’ directory contains several sub-directories:

1. ‘doc’: you may build the latest manual as PDF by issuing the command `make` inside this directory
2. ‘samples’: contains many sample problems
3. ‘config’: has all the configuration files
4. ‘src’: the actual source code
5. ‘bin’ and ‘lib’: supplemental scripts
6. ‘idl’, ‘python’, ‘julia’, etc.: data processing for diverse languages

2 Configure the shell

For a quick start, you need to load some environment variable into your shell. First, you enter to the freshly downloaded directory:

```
cd pencil-code
```

Depending on which shell you use, you can do that by a simple command:

```
. source.sh
```

that will work for `bash` and all `sh`-compatible shells, while this command:

```
source source.csh
```

is for `tcsh` and any `csh`-compatible shell.

3 Fortran

A FORTRAN and a C compiler are needed to compile the code. Both compilers should belong to the same distribution package and version (e.g. GNU GCC 4.8.3, 64 bit Linux).

3.1 Fortran on a MAC

For MAC, you first need to install XCODE from the website <http://developer.apple.com/>, where you have to register as a member. Alternatively, an easy to install gfortran binary package can be found at the website <http://gcc.gnu.org/wiki/GFortranBinaries>. Just download the archive and use the installer contained therein. It installs into `/usr/local/gfortran` with a symbolic link in `/usr/local/bin/gfortran`. It might be necessary to add the following line to the `“.cshrc”`-file in your `/home` folder:

```
setenv PATH /usr/local/bin:\$PATH
```

4 Try a sample

Go to a folder that contains one of the many available samples, e.g.:

```
cd samples/ld-tests/jeans-x
```

You may also start with a fresh directory and copy over the files from one of the samples.

4.1 Setting up...

One command sets up all needed symbolic links to the original Pencil Code directory:

```
pc_setupsrc
```

4.2 Makefile

Two basic configuration files define a simulation setup: `“src/Makefile.local”` contains a list of modules that are being used, and `“src/cparam.local”` defines the grid size and the number of processors to be used. Take a quick look at these files...

4.2.1 Single-processor

An example using the module for only one processor would look like:

```
MPICOMM=nompicomm
```

For most modules there is also a `“no”`-variant which switches that functionality off.

In `“src/cparam.local”` the number of processors needs to be set to 1 accordingly:

```
integer, parameter :: ncpus=1,nprocx=1,nprocy=1,nprocz=ncpus/(nprocx*nprocy)
integer, parameter :: nxgrid=128,nygrid=1,nzgrid=128
```

4.2.2 Multi-processor

If you like to use MPI for multi-processors simulations, be sure that you have a MPI library installed and change “src/Makefile.local” to use MPI:

```
MPICOMM=mpicomm
```

Change the `ncpus` setting in “src/cparam.local”. Think about how you want to distribute the volume on the processors — usually, you should have 128 grid points in the x-direction to take advantage of the SIMD processor unit. For compilation, you have to use a configuration file that includes the “_MPI” suffix, see below.

4.3 Compiling...

In order to compile the code, you can use a pre-defined configuration file corresponding to your compiler package. E.g. the default compilers are `gfortran` together with `gcc` and the code is being built with default options by issuing the command:

```
pc_build
```

4.3.1 Using a different compiler (optional)

If you prefer to use a different compiler package (e.g. using `ifort` or `MPI`), you may try:

```
pc_build -f Intel
pc_build -f GNU-GCC_MPI
```

More pre-defined configurations are found in the directory “pencil-code/config/compilers/*.conf”.

4.3.2 Changing compiler options (optional)

Of course you can also create a configuration file in any subdirectory of ‘pencil-code/config/hosts/'. By default, `pc_build` looks for a config file that is based on your `host-ID`, which you may see with the command:

```
pc_build -i
```

You may add your modified configuration with the filename “host-ID.conf”, where you can change compiler options according to the Pencil Code manual. A good host configuration example, that you may clone and adapt according to your needs, is “pencil-code/config/hosts/IWF/host-andromeda-GNU_Linux-Linux.conf”.

4.4 Running...

The initial conditions are set in “start.in” and the parameters for the main simulation run can be found in “run.in”. In “print.in” you can choose which physical quantities are written to the file “data/time_series.dat”.

Be sure you have created an empty ‘data’ directory. It is now time to run the code:

```
mkdir data
pc_run
```

Welcome to the world of Pencil Code!

4.5 Troubleshooting...

If compiling fails, please try first:

```
pc_build --cleanall
pc_build
```

If some step still fails, you may report to our mailing list: <http://pencil-code.nordita.org/contact.php>. In your report, please state the exact point in this quick start guide that fails for you (including the full error message) — and be sure you precisely followed all non-optional instructions from the beginning.

In addition to that, please report your operating system (if not LINUX-based) and the shell you use (if not bash). Also please give the full output of these commands:

```
bash
cd path/to/your/pencil-code/
source sourceme.sh
echo $PENCIL_HOME
ls -la $PENCIL_HOME/bin
cd samples/ld-tests/jeans-x/
gcc --version
gfortran --version
pc_build --cleanall
pc_build -d
```

If you plan to use MPI, please also provide the full output of:

```
mpicc --version
mpif90 --version
mpiexec --version
```

5 Data post-processing

5.1 IDL visualization (optional, recommended)

5.1.1 GUI-based visualization (recommended for quick inspection)

The most simple approach to visualize a cartesian grid setup is to run the Pencil Code GUI and to select the files and physical quantities you want to see:

```
IDL> .r pc_gui
```

If you miss some physical quantities, you might want to extend the two IDL routines `pc_get_quantity` and `pc_check_quantities`. Anything implemented there will be available in the GUI, too.

5.1.2 Command-line based processing of “big data”

Please check the documentation inside these files:

“pencil-code/idl/read/pc_read_var_raw.pro”	efficient reading of raw data
“pencil-code/idl/read/pc_read_subvol_raw.pro”	reading of sub-volumes
“pencil-code/idl/read/pc_read_slice_raw.pro”	reading of any 2D slice from 3D snapshots
“pencil-code/idl/pc_get_quantity.pro”	compute physical quantities out of raw data
“pencil-code/idl/pc_check_quantities.pro”	dependency checking of physical quantities

in order to read data efficiently and compute quantities in physical units.

5.1.3 Command-line based data analysis (may be inefficient)

Several IDL-procedures have been written (see in ‘pencil-code/idl’) to facilitate inspecting the data that can be found in raw format in ‘jeans-x/data’. For example, let us inspect the time series data

```
IDL> pc_read_ts, obj=ts
```

The structure `ts` contains several variables that can be inspected by

```
IDL> help, ts, /structure
** Structure <911fa8>, 4 tags, length=320, data length=320, refs=1:
  IT          LONG      Array[20]
  T           FLOAT     Array[20]
  UMAX        FLOAT     Array[20]
  RHOMAX      FLOAT     Array[20]
```

The diagnostic `UMAX`, the maximal velocity, is available since it was set in “jeans-x/print.in”. Please check the manual for more information about the input files.

We plot now the evolution of `UMAX` after the initial perturbation that is defined in “start.in”:

```
IDL> plot, ts.t, alog(ts.umax)
```

The complete state of the simulation is saved as snapshot files in “jeans-x/data/proc0/VAR*” every `dsnap` time units, as defined in “jeans-x/run.in”. These snapshots, for example “VAR5”, can be loaded with:

```
IDL> pc_read_var, obj=ff, varfile="VAR5", /trimall
```

Similarly `tag_names` will provide us with the available variables:

```
IDL> print, tag_names(ff)
T X Y Z DX DY DZ UU LNRHO POTSELF
```

The logarithm of the density can be inspected by using a GUI:

```
IDL> cslice, ff.lnrho
```

Of course, for scripting one might use any quantity from the `ff` structure, like calculating the average density:

```
IDL> print, mean(exp(ff.lnrho))
```

5.2 Python visualization (optional)

Be advised that the PYTHON support is still not complete or as feature-rich as for IDL.

5.2.1 Python module requirements

For this example we use the modules: `numpy` and `matplotlib`.

5.2.2 Using the 'pencil' module

After sourcing the “`sourceme.sh`” script (see above), you should be able to import the `pencil` module:

```
import pencil as pc
```

Some useful functions:

“ <code>pc.read_ts</code> ”	read “ <code>time_series.dat</code> ” file. Parameters are added as members of the class
“ <code>pc.read_slices</code> ”	read 2D slice files and return two arrays: (nslices,vsize,hsize) and (time)
“ <code>pc.animate_interactive</code> ”	assemble a 2D animation from a 3D array
